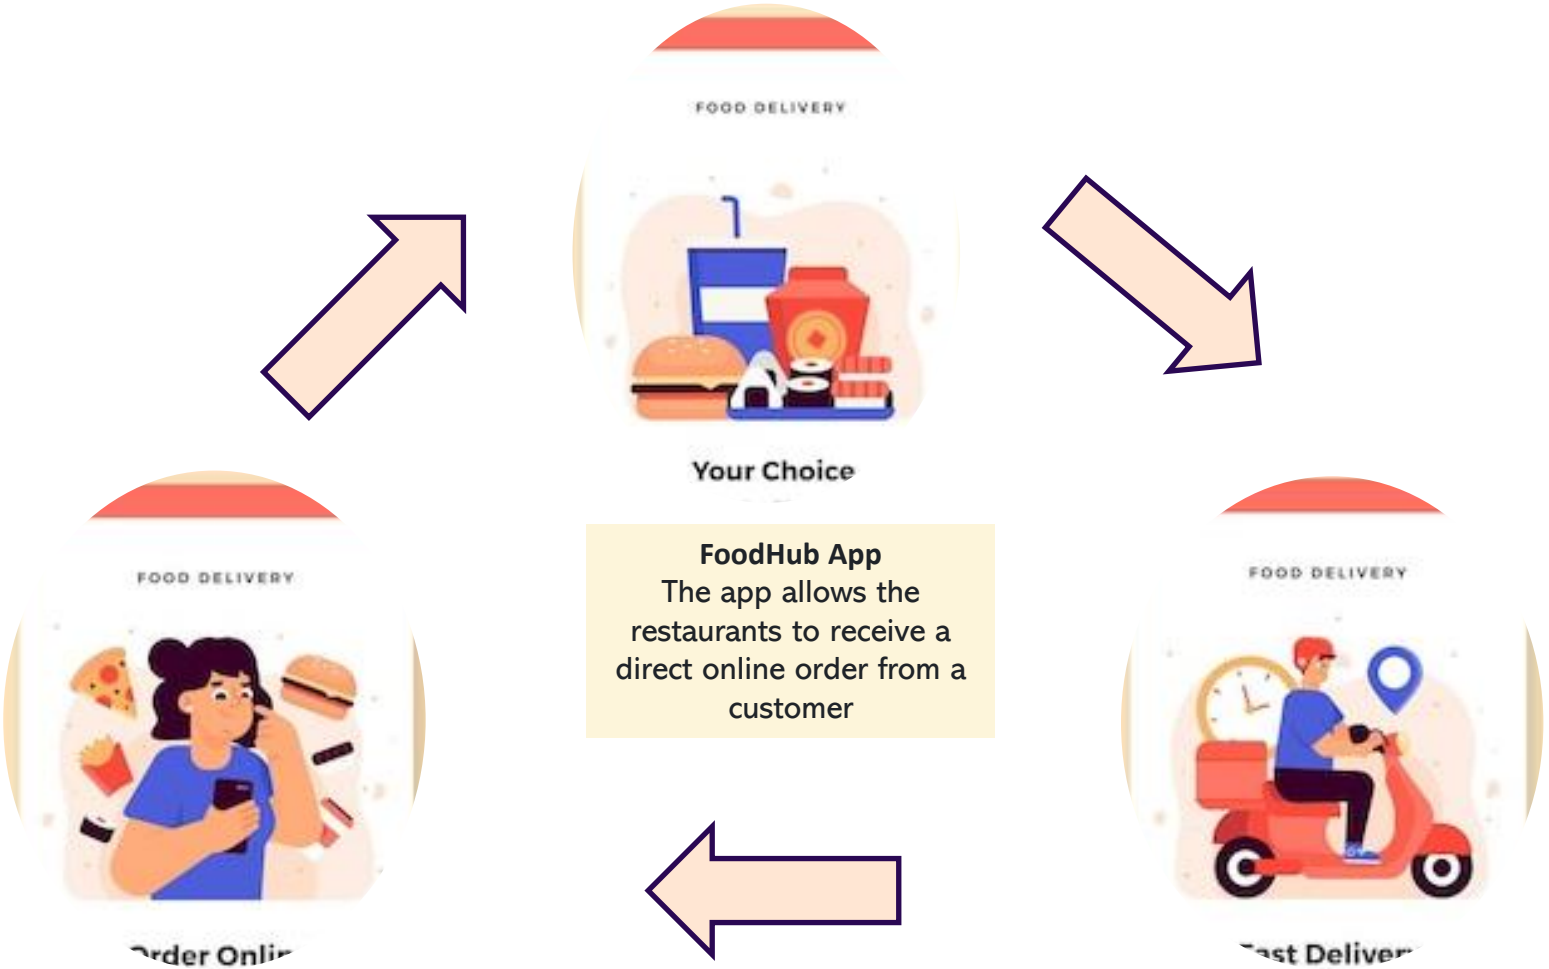
FoodHub Data Analysis and Recommendations – Who?

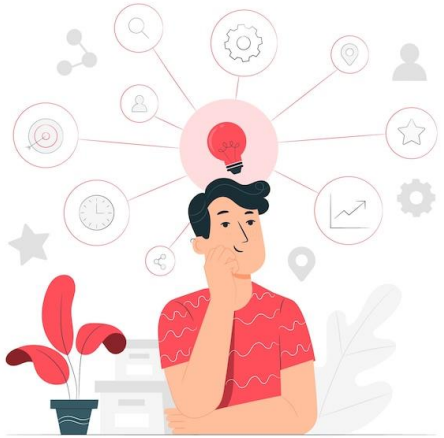
A food aggregator company FoodHub offers access to multiple restaurants through a single smartphone app.



FoodHub App
The app allows the restaurants to receive a direct online order from a customer

Prepared by
C. Rudder

FoodHub Data Analysis and Recommendations – What?



The food aggregator company has stored the data of the different orders made by the registered customers in their online portal.

They want to analyze the data to get a fair idea about the demand of different restaurants which will help them in enhancing their customer experience.

Analyze data to **gain insight** into the demand of the different restaurants in order to enhance the customer experience.

1. Which are the top 5 restaurants in terms of the number of orders received?
2. Which is the most popular cuisine on weekends?
3. What percentage of the orders cost more than 20 dollars?
4. What is the mean order delivery time?
5. What is the net revenue generated by the company across all orders?
6. What percentage of orders take more than 60 minutes to get delivered from the time the order is placed?
7. How does the mean delivery time vary during weekdays and weekends?

FoodHub Data Analysis and Recommendations - How

Python libraries:
Numpy Pandas Matplotlib Seaborn

Data Analysis Strategies:
- Summary Statistics
- Exploratory Data Analysis
- Univariate Analysis
- Bivariate Analysis

The data contains the different data related to a food order.

Data Dictionary

order_id: Unique ID of the order
customer_id: ID of the customer who ordered the food
restaurant_name: Name of the restaurant
cuisine_type: Cuisine ordered by the customer
cost: Cost of the order
day_of_the_week: Indicates whether the order is placed on a weekday or weekend (The weekday is from Monday to Friday and the weekend is Saturday and Sunday)
rating: Rating given by the customer out of 5
food_preparation_time: Time (in minutes) taken by the restaurant to prepare the food. This is calculated by taking the difference between the timestamps of the restaurant's order confirmation and the delivery person's pick-up confirmation.
delivery_time: Time (in minutes) taken by the delivery person to deliver the food package. This is calculated by taking the difference between the timestamps of the delivery person's pick-up confirmation and drop-off information

FoodHub Data Analysis and Recommendations - Conclusions

Food Preparation and Delivery

The food preparation time ranged **20 to 35 minutes**

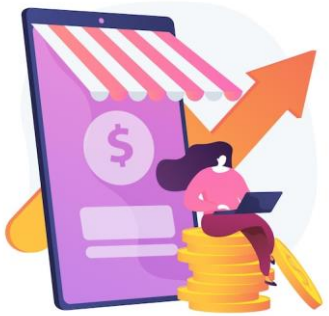
The food delivery time ranged from **15 to 33 minutes**

The mean deliver time by day of the week:

Weekday 28.34 minutes

Weekend 22.47 minutes

10% of the orders placed take over 60 minutes for delivery, from the time it was placed.



Net Revenue

Almost all orders are charged a fee:

15% for orders over '5 USD'

25% for orders over '20 USD'

The company received a **net revenue of $6166.31** across all orders.

C. Rudder

FoodHub Data Analysis and Recommendations

Recommendations:

1. As the mean averages are $16.50, look at how the charges are broken down.
   It may be beneficial to **increase the fee to 20% for orders over $10**.

2. To gain more reviews from the customers add a **$5 off coupon on their next order** for them leaving a review.
   This would *increase customer engagement* and *encourage return business*.

3. Foodhub could have **delivery drivers closer to the restaurants** which receive the most orders.
   The food prep and delivery had reasonable time frames with 75% taking 56 minutes or less.
